

TASK #2 Download& Install a Server (LOCALHOST)

Task two is to download and install a server (localhost) in our device. I faced some problems like the XAMPP program want to use port 80 and this port used by another program (see Figure1), so I need to change the port. I made a search for the problem and I found the solution. the solution is to change the SSL port and main port from the files and in the program (see Figure2, Figure3, Figure4).
